DETAILED ACTION

1. Prior to the instant office action, claims 1-3, 5, 6, 8, and 10-12 were pending. In the instant office action, claims 1 and 12 are amended, claim 2 is canceled. Claims 1, 3, 5, 6, 8, and 10-12 are allowed over the prior art of record.
2. An Examiner's Amendment to the record appears below. Should the changes and/or additions be unacceptable to Applicant, an amendment may be filed as provided by 37 C.F.R. 1.312. To ensure consideration of such an amendment, it **MUST** be submitted no later than the payment of the issue fee.
3. Authorization for this examiner's amendment was given in a telephone call received by an attorney working under Applicant's representative William Gehris, when the attorney returned the Examiner's phone call on behalf of William Gehris on 5/27/2009.

EXAMINER'S AMENDMENT

Claim 1: (Currently Amended) A method for simulating process flows in the graphics industry and for displaying the result calculated in the simulated process flows and/or intermediate results, comprising the steps of:

inputting or selecting at least one order data set representing a print job via a user interface of a computer;

selecting process data sets representing machines via a graphical user interface, the process data sets representing the machines being stored in a library, the print job determining

minimum requirements to be met by a machine to be eligible as a process data set for a simulation and excluding machines that do not meet the requirements from the simulation;

distributing the at least one order data set among the selected process data sets;

calculating links between the order data set and the process data sets as a function of the order data set and the process data set;

wherein the calculating of the links between the order data set and the process data set includes an evaluation method, the evaluation method including making a query as to which process data set is capable of processing an input or selected order data set of the at least one process data set so as to define positively queried process data set; writing the positively queried process data sets to a resource table; establishing a ranking of the positively queried process data sets as a function of the process flow data and the order data set; selecting the process data set with a highest ranking; assigning the process data set with the highest ranking to the selected order data set;

creating a process flow from the calculated links;

calculating results or intermediate results for the process flow using the order data set;

and

outputting the results or intermediate results on a display of the computer.

Claim 2: (Canceled)

Claim 12: (Currently Amended) A device for simulating process flows in the graphics industry and for displaying the result calculated in the simulated process flows or intermediate results on a display device, comprising:

at least one user interface for inputting or selecting at least one order data set representing a print job, the print job determining minimum requirements to be met by a machine to be eligible as a process data set for a simulation;

at least one graphical user interface for selecting process data sets representing machines;

at least one computer for excluding machines that do not meet the requirements of the print job from the simulation and for distributing the at least one order data set among the selected process data sets and for calculating links between order data set and process data sets as a function of the order data set and the process data sets;

wherein the calculating of the links between the order data set and the process data set includes an evaluation method, the evaluation method including making a query as to which process data set is capable of processing an input or selected order data set of the at least one process data set so as to define positively queried process data sets; writing the positively queried process data sets to a resource table; establishing a ranking of the positively queried process data sets as a function of the process flow data and the order data sets; selecting the process data set with a highest ranking; and assigning the process data set with the highest ranking to the selected order data set;

the computer for creating a process flow from the calculated links;

the computer for calculating the result or intermediate results from the process flow using the order data set; and

a display for displaying the results or intermediate results.

Allowable Subject Matter

4. The following is an Examiner's statement of reasons for allowance: After further reviewing the Applicant's remarks and granting further consideration to the cited prior art, it appears that the prior art fails to teach and or suggest all the limitations of newly amended claims 1 and 12. Specifically, the prior art of record fails to disclose "the print job determining minimum requirements to be met by a machine to be eligible as a process data set for a simulation and excluding machines that do not meet the requirements from the simulation; establishing a ranking of the positively queried process data sets as a function of the process flow data and the order data set; selecting the process data set with a highest ranking; and assigning the process data set with the highest ranking to the selected order data set."

The preceding limitations, when combined with the rest of the claim limitations recited in claims 1 & 12, results in a combination of elements that is both novel and unobvious over the prior art of record.

5. Any comments considered necessary by Applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments of Reasons for Allowance."
